

Delivery

Emergency reference · current as of 2026-04-22

WHAT IT IS

A web app used in the warehouse to check in the daily produce delivery. The delivery worksheet (a PDF from IT) is uploaded each morning; warehouse staff walk the floor marking items as received/short/over, flagging pulls destined for the retail floor, and reviewing a 3-day high-count forecast. Exceptions are captured for the buyer at end of day.

WHERE IT RUNS

Live URL	<code>https://delivery-app-481756503401.us-east1.run.app</code>
Hosting	Google Cloud Run – project <code>delivery-worksheet-app</code> , region <code>us-east1</code> , service <code>delivery-app</code>
Data backend	Firebase (Firestore + Storage) in the same GCP project

WHERE THE CODE LIVES

GitHub repo	<code>https://github.com/kjmacgrub/Delivery</code>
Local checkout	<code>/Users/km/python3/source/Delivery</code>

ACCOUNTS YOU'D NEED

- **GitHub** — owner: `kjmacgrub`. Add IT as collaborator to grant code access.
- **Google Cloud** — project `delivery-worksheet-app`. Controls Cloud Run deploys, Cloud Build, Secret Manager, and IAM.
- **Firebase console** — same project `delivery-worksheet-app`. Holds Firestore (delivery records), Storage (uploaded worksheet PDFs + CSVs), and security rules.

IF IT'S BROKEN — START HERE

1. **Site is down** → GCP console → Cloud Run → `delivery-app` → Revisions tab. Roll back to the last known-good revision if the latest is red.
2. **Today's worksheet won't load** → Firebase console → Storage bucket `delivery-worksheet-app.firebaseio.com`, path `delivery-files/incoming/`. Confirm today's file arrived.
3. **Data missing / parse looks wrong** → Firestore → `deliveries` collection. Compare the Firestore doc to the source PDF; re-upload the PDF to trigger re-parse if needed.
4. **Deploy failed** → GCP console → Cloud Build → History. Typical fix: re-run `./deploy.sh` from a clean checkout.

WHO TO CALL

Primary owner: Ken MacGruber (`kjmacbcg@gmail.com`). All credentials, service accounts, and deploy history route through this email.
